**Sampling Techniques for Development Evaluation** 

#### National Evaluation Capacities (NEC) Conference 2019 No One Left Behind

Hurghada, Egypt

October 20-24, 2019.

Bassirou Chitou, Ph. D.

#### **Presentation Outline**

#### Workshop Objectives

Module I: Basic Sampling Concepts

Module II: Types of Random Sampling

Module III: Multi-Stage Sampling

## **PART I: BASIC SAMPLING CONCEPTS**

### **GENERAL OBJECTIVES OF THIS TRAINING**

 Point out potential roadblocks or challenges to a successful evaluation;

- provide you with tools and ideas to deal with them;
- open your curiosity and wet your appetite to learn more.

#### **SPECIFIC OBJECTIVES OF THIS TRAINING**

- Correct common misconceptions;
- Understanding various types of random;
- Skills in drawing several types of samples;
- Skills in drawing multi-stage household samples;
- Skills in using several web-based and MS Excel tools.

## MYTH 1 AND MYTH 2

### Myth 1

• Sampling NOT important to the validity of an evaluation if data collection is very well done . WRONG !

#### Myth 2

Studies based on a sample are inherently inferior to those based on a census.
WRONG !

## **Key Terms in Sampling**

- Unit of Analysis
- Population (Universe)
- Sampling Frame (Frame)
- Census
- Sample
- Sampling Error
- Response Rate
- Data Availability

#### **Relationship among Key Sampling Terms**

## Myth 3:

 Non-response can be solved by over-sampling or by follow-up sampling, to achieve desired sample size.
WRONG!

## PART II: TYPE OF RANDOM SAMPLING PG. XX – PG. XX

## **Types of Random Samples**

- **Simple random sample**
- Equal probability systematic sample (SYS)
- Random interval sample
- Stratified random sample
- **Random cluster sample**
- Multistage random sample

## Myth 4:

# Random samples are always representative of the population from which they are drawn. WRONG!

Part I

## Myth 5:

Random sampling can rarely be used in development evaluations because resources usually allow only small samples and we need to assure that the sample includes units from small sectors, regions, and/or minority groups.

WRONG!

**Appendix A: World Bank Funded Operations** 

**Show Appendix A** 

## Myth 6:

In development evaluation work, usually our only option is to collect data from the units convenient to the evaluator.
WRONG!

## Myth 7:

 If I draw a purposeful sample to be representative of the population, I can use statistical significance and confidence intervals.

## WRONG!

#### **Table 1: Random Sample Selection Guide**

| Your Objective                                    | Generally Best Type of Random<br>Sample  |
|---|--|
| Generalize to the population                      |  |
| Can afford a large sample                         | Simple random sample   |
| Can only afford a small sample                    | Stratified random sample—proportional  |
| Expensive to access scattered units               | Multi-stage random sample, starting with a random cluster sample                   |
| Sampling frame hard to enumerate                  | Systematic Sampling  |
| Compare groups of unequal size in the population. | Stratified random sample-disproportional<br>(draw the same number from each group) |

## Myth 8:

## You should always draw the largest sample that is feasible.

WRONG!

## Myth 9

## If the evaluation is an important one, people will cooperate and provide the needed data. WRONG!

#### SIX STRATEGIES FOR MAXIMIZING RESPONSE RATES

- Requested information will contribute to something that the respondents value—for themselves, their families, or their communities;
- Provide credible promises of confidentiality for the responses;
- **Use people of influence to help solicit participation;**
- Minimize the inconvenience and burden on respondents;
- Offer incentives;
- **Be persistent.**

## PART III: MULTI-STAGE SAMPLING

#### **Two Reasons for Multi-Stage Sampling**

- Units scattered over a large geographical area, making it time-consuming and expensive to take a simple random or stratified random sample of the units;
- there is no up-to-date sampling frame for the units of analysis but there is an up-to-date sampling frame for naturally occurring clusters of these units.

## **Some popular clusters**

| Purpose  | 1 <sup>st</sup> stage sampling<br>unit:<br>Cluster                | 2 <sup>nd</sup> stage sampling<br>unit:                     | 3 <sup>rd</sup> stage sampling<br>unit |
|--|---|---|--|
| Condition of bridges<br>rated at 5 tons or greater<br>load | Province or state   | Bridges rated at 5 tons or greater load                     | N/A                                    |
| Condom use among<br>Female Sex Workers                     | Brothel, massage parlor,<br>bar, city block                       | Female Sex Workers  | N/A                                    |
| Mechanization by small<br>manufacturing<br>facilities      | City, town  | Manufacturing facilities<br>with less than ten<br>employees | N/A                                    |
| Youth Knowledge of HIV and Sexual Behaviors                | School, household,<br>locations where "street<br>children" gather | Youth   | N/A                                    |
| Student's aspirations for secondary education              | Primary schools   | Fifth grade classrooms                                      | Students                               |
| Cell phone use by street vendors                           | Cities  | Marketplaces  | Vendors                                |

#### How to conduct a two-stage cluster sampling

#### **Stage 1: Selection of clusters**

- Clusters selected using PPS
- Listing and mapping of all SSU in each selected

#### **Stage 2: Selection of secondary sampling units using SYS**

### Advantages of two-stage cluster samples

- Two stages sampling usually offers considerable efficiency with only moderate increases in sampling errors;
- The use of residential households as the second-stage sampling unit guarantees the best coverage of the target population;
- A household listing procedure, after the selection of the first stage and before the actual data collection, provides an up-to-date sampling frame for household selection in the second stage;
- It guarantees a representative sample of the target population when there is a list of all clusters to be sampled but not a list of all target individuals within each cluster

## **Procedures for PPS sampling (1)**

- **Step 1: Prepare a list of clusters with corresponding mos for each;**
- Step 2: Starting at the top of the list, calculate the cumulative mos and enter these figures in a column next to the measure of size for each unit;
- Step 3: Determine the range corresponding to each unit. The lower limit of the range is the previous row's upper limit of the range plus one. The upper limit is the – cumulative mos. Record the range in the column to the right of mos;
- Step 4: Calculate the sampling interval (SI) by dividing the total cumulative mos, by the number of units to be selected , that is:

SI = mos/number of unit to be selected

## **Procedures for PPS sampling (2)**

- Step 5: Select a random number (r) between 1 and (SI). The r may be a decimal number. If it is, it is a good practice to retain 2 digits after the decimal;
- Step 6: Compute subsequent random numbers. These are obtained by adding the sampling interval (SI) to r; that is:

r; r + SI; r + 2SI; ...; r + (a-1)SI

Step 7: Select each cluster whose range contains the number obtained in step 6;

Note: In selecting clusters, the SI decimal points MUST be retained and the following rule is applied. When the decimal part of the sample selection number is less than 5, the lower numbered cluster is chosen, and when the decimal part of the sample selection number is 5 or greater, the higher numbered cluster is chosen.

#### Table 11.4.3: Selection of four Villages (clusters) using PPS

|   | mos:        |                |             | Sample      | Cluster  |  |  |
|---|-------------|----------------|-------------|-------------|----------|--|--|
| <b>Cluster Num</b>  | # HH listed | Cumulative mos | Range       | Selection # | Selected |  |  |
| 1   | 163         | 163            | 1 - 163     | 22          | *        |  |  |
| 2   | 250         | 413            | 164 - 413   |             |          |  |  |
| 3   | 110         | 523            | 414 - 523   |             |          |  |  |
| 4   | 210         | 733            | 524 - 733   | 638         | *        |  |  |
| 5   | 207         | 940            | 734 - 940   |             |          |  |  |
| 6   | 160         | 1100           | 941 - 1100  |             |          |  |  |
| 7   | 165         | 1265           | 1101 - 1265 | 1254        | *        |  |  |
| 8   | 180         | 1445           | 1266 - 1445 |             |          |  |  |
| 9   | 140         | 1585           | 1446 - 1585 |             |          |  |  |
| 10  | 309         | 1894           | 1586 - 1894 | 1870        | *        |  |  |
| 11  | 245         | 2139           | 1895 - 2139 |             |          |  |  |
| 12  | 325         | 2464           | 2140 - 2464 |             |          |  |  |
| Number of clusters to be selected = 4 ; SI = 2464 / 4 = 616; r = 22 |             |                |             |             |          |  |  |
| * = Selected clusters   |             |                |             |             |          |  |  |

#### **EXERCISE:** PPS to select a sample of two villages (Part 1)

| Village ID | Number of<br>Households<br>in Each Village | Cumulative mos | Range | Sample Selection<br>Number |
|------------|--|----------------|-------|----------------------------|
| 1          | 50   |                |       |                            |
| 2          | 30   |                |       |                            |
| 3          | 10   |                |       |                            |
| 4          | 20   |                |       |                            |
| 5          | 40   |                |       |                            |
| 6          | 30   |                |       |                            |

#### **EXERCISE:** PPS to select a sample of two villages (Part 2)

| Village ID | Number of<br>Households<br>in Each Village | Cumulative mos | Range     | Sample Selection<br>Number |
|------------|--|----------------|-----------|----------------------------|
| 1          | 50   | 50             | 1 - 50    |                            |
| 2          | 30   | 80             | 51 - 80   | *                          |
| 3          | 10   | 90             | 81 - 90   |                            |
| 4          | 20   | 110            | 91 – 110  |                            |
| 5          | 40   | 150            | 111 - 150 | *                          |
| 6          | 30   | 180            | 151 - 180 |                            |

Advantage of systematic sampling at the second stage

- The selected households come from throughout the cluster, rather than being concentrated in one or two areas, which could happen by chance if a simple random sample is used;
- If necessary or desirable, the actual sampling can be done easily in the field with a minimum of training of the field staff;
- It allows for easy verification of fieldwork, walking a specified pattern and checking the selected SSUs.

#### Kish Grid for selecting one respondent from several eligible within a household

| Tail # of household | Selected indinidual's line number according to number of eligible individuals in the household |   |   |   |   |   |   |   |   |    |
|---------------------|--|---|---|---|---|---|---|---|---|----|
| questionaire        | 1  | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| 0                   |  | 1 | 3 | 4 | 4 | 4 | 7 | 7 | 9 |    |
| 1                   | 1  | 2 | 1 | 1 | 5 | 5 | 1 | 8 | 1 | 2  |
| 2                   | 1  | 1 | 2 | 2 | 1 | 6 | 2 | 1 | 2 | 3  |
| 3                   | 1  | 2 | 3 | 3 | 2 | 1 | 3 | 2 | 3 | 4  |
| 4                   | 1  | 1 | 1 | 4 | 3 | 2 | 4 | 3 | 4 | 5  |
| 6                   | 1  | 2 | 2 | 1 | 4 | 3 | 5 | 4 | 5 | 6  |
| 6                   | 1  | 1 | 3 | 2 | 5 | 4 | 6 | 5 | 6 | 7  |
| 7                   | 1  | 2 | 1 | 3 | 1 | 5 | 7 | 6 | 7 | 8  |
| 8                   | 1  | 1 | 2 | 4 | 2 | 6 | 5 | 7 | 8 | 9  |
| 9                   | 1  | 2 | 3 | 3 | 3 | 6 | 6 | 8 | 9 | 10 |
